

In this laboratory work I implemented RPC to build a “numberprocessing” service which does the following tasks: find n-th Fibonacci number. Client side project was written on Java as Android app, server side was written on Java too.

In fact, this Lab is rebuildled from 5<sup>th</sup>. I've just move Worker to server side and there is one more queue: one for putting number (n), another for result of function Fibonacci(n).

There is one issue with IP address. Since my laptop act as server, but doesn't have static IP, client and server apps should be connect to one WI-FI connection.

So, all other things as in Lab5.
